Example 26: (light-stabilising action in polypropylene tapes) 1 g of each of the products indicated in Table 2, 0.5 g of tris(2,4-di-*t*-butylphenyl) phosphite, 0.5 g of pentaerythritol tetrakis- [3-(3,5-di-*tert*-butyl-4-hydroxyphenyl)propionate] and 1 g of calcium stearate are mixed in a slow mixer with 1000 g of polypropylene powder of melt index = 12 g/10 minutes (measured at 230°C and 2.16 kg).

The mixtures are extruded at 200-220°C to give polymer granules which are then converted into stretched tapes of 50 µm thickness and 2.5 mm width, using a pilot-type apparatus (@Leonard-Sumirago (VA) Italy) operating under the following conditions:

Extruder temperature: 210-230°C
 Head temperature: 240-260°C
 Stretch ratio: 1:6

The tapes thus prepared are exposed, mounted on a white card, in a model 65WR Weather-O-Meter (ASTM D 2565-85) with a black panel temperature of 63°C.

The residual tenacity is measured on samples taken after various times of exposure to light by means of a constant-speed tensometer, and the exposure time in hours (T₅₀) needed to halve the initial tenacity is then calculated.

Tapes prepared under the same conditions as indicated above, but without addition of stabilisers of the invention, are exposed for comparison.

The results obtained are shown in Table 2.
